

Poker Night

Role-Based User Flows & Permission Specification

Administrator

Registered Group Member

New Guest

Document type: Complete start-to-end user journeys, with explicit permission boundaries (Can / Cannot), for every role

Source of truth: Poker Night Complete User Flow & Experience Specification v1.0, MVP Technical Specification v2.0, and Human Product Guide

Version: 1.0 — Consolidated Reference Edition

Prepared: 7 August 2026

Contents

- 1 Product Model & Roles Overview
- 2 Shared Rules That Govern Every Role
- 3 Administrator — Complete Flow & Permissions
 - 3.1 Full start-to-end journey
 - 3.2 Live-operations detail (elimination, rebuy, settlement, final table)
 - 3.3 Can / Cannot — full permission table
- 4 Registered Group Member — Complete Flow & Permissions
 - 4.1 Full start-to-end journey
 - 4.2 Can / Cannot — full permission table
- 5 New Guest — Complete Flow & Permissions
 - 5.1 Full start-to-end journey
 - 5.2 Can / Cannot — full permission table
- 6 Cross-Role Permission Matrix
- 7 Contextual Main-Button Logic (per role, per state)
- 8 Notifications Matrix (per role)
- 9 Validation, Errors & Edge Cases (mapped to role)
- 10 Glossary

1. Product Model & Roles Overview

Poker Night is not an online poker game — it does not deal cards, determine hand winners, track pots, or show a graphical table. It manages the real-world event around a physical Texas Hold'em game: invitations, attendance, chip preparation, tournament structure, timer, rebuys, add-ons, seating, prize calculations, communication and results.

1.1 The three structural objects

Object	Definition
Group	A private, persistent community of regular players. Contains group chat, polls, upcoming/completed events, reusable tournament presets and saved chip sets. A person may belong to more than one group.
Event	One scheduled poker night created inside a group. Visible only to that group's registered members, plus invited guests holding the event link/QR/code. Contains invitation, RSVP list, guest slots, check-in, tournament preparation, live state and final results.
Live Tournament	Begins only once the admin confirms real attendance and generates the final structure. The system then synchronises timer and permitted information across admin, player, guest and TV views.

1.2 The three roles

Role	Who they are	Core capability level
Administrator	The host. Exactly one admin per event.	Full control — creates, configures, and operates everything
Registered Group Member	A signed-in player who belongs to the group	Social + participatory — RSVP, chat, polls, check-in, live-follow
New Guest	An unregistered person invited by a member	Event-only — check-in and live-follow for a single event, no account required

Permissions are enforced **server-side**, not by hiding buttons in the interface. The same tournament record may contain private financial information, but the API response returned to a player or guest omits that information entirely. A visual "Host View" toggle is never treated as a security boundary.

2. Shared Rules That Govern Every Role

These rules sit underneath all three flows below. They are referenced rather than repeated in each role section.

2.1 RSVP rules

- Each registered group member has exactly one active response at a time.
- Available responses: **Going, Going +1, Going +2, Going +3, Going +4, Maybe, Can't Come.**
- "Going +2" means one registered member plus two guest slots — three expected participants in total.
- Responses may be changed until **one hour before** the scheduled start time.
- The admin may correct or reopen an RSVP when necessary.
- "Maybe" does not reserve a seat and is not included in the confirmed player count.

2.2 Check-in rules

- A registered member can self check-in or be checked in by the admin.
- A guest can request check-in only after claiming a valid guest slot.
- No player receives a table and seat until check-in is confirmed by the admin.
- Late registration closes **permanently** at the end of the selected rebuy level (normally Level 6) — for every role, with no exceptions.

2.3 Tournament structure rules

- The final structure is generated from actual attendance, selected duration and the real physical chip set — never from assumptions.
- Level durations may only be 10, 15 or 20 minutes.
- Starting stack and opening blinds are solved together; there is no universal fixed starting stack.
- Blind values must be practical with the chips in play; the small blind does not have to equal exactly half the big blind.
- Existing levels are never removed during play. Future levels may only be changed, or a future intermediate level inserted, after admin confirmation.
- No individual chip stacks are tracked. Average stack is always derived as total chips in play ÷ active players.

2.4 Financial visibility rules

- Before the rebuy/add-on break is settled: members and guests see "**Estimated Prize Pool.**"
- After settlement: members and guests see "**Prize Pool.**"
- Players and guests **never** see individual payout amounts, organizer percentage, organizer amount, rebuy totals, or add-on totals.
- After the tournament, all paid positions are visible to everyone — without money amounts.

- The admin privately sees the complete calculation and every payout amount.
- Currency symbols are hidden in the primary interface — the app displays `15` or `15 + 5`, never `€15`.

3. Administrator — Complete Flow & Permissions

ROLE: ADMINISTRATOR

STARTING POINT	END GOAL	ADMINS PER EVENT
Sign-in / Home	Tournament run start-to-finish, results published, group history updated	Exactly one

3.1 Full start-to-end journey

Stage 1 — Setup

- 1 Sign in → Home.** Home is not a generic dashboard; it surfaces only what needs attention right now:
 - Active tournament, if one exists
 - Next upcoming event
 - Pending guest or player check-ins
 - Confirmed attendance
 - Latest group message and latest poll
 - Primary actions: **Create Event** and **Start Cash Game**
- 2 Create or open a group.** Enter group name, optional image, optional description → system generates a private group invitation link, group code, and QR code → admin shares it with regular players → players join and gain access to Chat, Events, Polls and History.
- 3 Create a tournament event** via a short guided wizard (not one long settings page):
 - **Step 1 — Event Details:** name, date, start time, location (optional)
 - **Step 2 — Tournament Options:** buy-in, rebuy-closing level (default Level 6), add-on on/off, KO bounty on/off, target duration (default 3.5h, selectable 3–6h in half-hour steps)
 - **Step 3 — Event Preview & Publish:** admin previews the exact card group members will see — concise, friendly, readable in the chat feed
- 4 Publish the event.** On tapping Publish, the system automatically: adds the event to the group's Events tab; posts and pins the event card in group chat; notifies group members; opens RSVP responses.

Stage 2 — Pre-event operations

- 5 Monitor RSVPs.** A live attendance summary separated into Confirmed members, Guest slots, Maybe, Can't Come and No Response. The interface shows both *people* and *seats* — one "Going +2" represents three expected players.

6 Configure the physical chip set — before the event or shortly before check-in closes — via one of three paths:

- **Option A — Saved Chip Set:** select a reusable chip set already stored in the group (colours, values, optional exact quantities)
- **Option B — Exact Inventory:** select/create each chip colour, indicate printed or unnumbered, enter a unique value, enter exact quantity available; the system guarantees the proposed starting stacks, rebuy reserve and add-on reserve fit the inventory
- **Option C — Quick Automatic Setup:** select available colours, indicate numbered/unnumbered, enter printed values where applicable, drag colours from most-available to least-available; for unnumbered chips Poker Night proposes unique values (two colours may never share a value); system shows required quantities and asks the admin to confirm enough chips exist

7 Event-day preparation checklist. Home and the event page present a checklist so the admin never has to remember the sequence:

- Review event information and any recent changes
- Open check-in
- Confirm chip set and inventory
- Review expected late arrivals
- Prepare starting stacks
- Reserve rebuy and add-on chips
- Open TV Mode if required
- Test voice announcements

8 Check-in management. Admin taps Open Check-in → registered members and guests see the Check In action → requests appear in the admin queue → admin confirms each request, or checks a person in manually → the system assigns a table and seat only after confirmation. Admin can also view confirmed-but-absent people, pending guests, Maybe arrivals and expected late arrivals.

Stage 3 — Generating & starting the tournament

9 Generate the final tournament structure — triggered only once the admin confirms actual attendance and final chip availability (an earlier provisional recommendation may exist, but is not authoritative). The generated result includes:

- Starting stack and opening blinds, and starting depth in big blinds
- Full blind progression, with level duration fixed at 10, 15 or 20 minutes
- Starting-stack chip recipe and rebuy-stack chip recipe (may use larger denominations later, same total value)
- Estimated add-on recommendation
- Ante type and activation level
- Number of tables and random seat assignment, plus initial dealer position
- Estimated finishing window, and any inventory warnings / colour-up instructions

- 10 **Start the tournament.** Admin reviews and confirms the generated structure → players receive table and seat assignments → TV Mode becomes available via its read-only URL/code → the initial dealer position is displayed and may be announced → admin taps **Start Tournament** → the timer begins and all connected views synchronise.

Stage 4 — Live operations (see §3.2 for full detail)

- 11 **Operate the live admin screen** — prioritising speed and error prevention: the most-used controls (Pause/Resume, Next Level, Eliminate) stay visible; uncommon or dangerous actions live behind a secondary "Manage Tournament" area.
- 12 **Manage players throughout play:** view or change seat; eliminate a player; eliminate-and-rebuy while the rebuy window is open; undo an elimination; record one add-on during the settlement break; mark a final position.
- 13 **Handle the end-of-rebuy / add-on settlement break** when the selected rebuy level ends (full detail in §3.2).
- 14 **Approve or ignore live pacing recommendations** if actual pace materially diverges from the target finish window.
- 15 **Manage table balancing** and, if the event began multi-table, run the final-table redraw at nine players remaining.

Stage 5 — Finishing

- 16 **Finish the tournament.** Admin confirms the winner and all final positions → system validates that every paid position has exactly one player → admin reviews the private payout calculation and any agreed deal → players and guests receive the final paid-position list without amounts → the event moves to **Finished** and is stored in group History → basic group statistics update.

✓ **Goal reached:** tournament fully run end-to-end, results published to all participants, event archived in group History, group ready for the next event.

3.2 Live-operations detail

Elimination and rebuy micro-flow

- 1 Admin selects a player and taps **Eliminate**.

2 Before the rebuy deadline, the system asks: *"Leave Tournament or Rebuy?"*

If Rebuy is selected: the player normally keeps the same seat and receives a rebuy stack with the same total value as the original starting stack — physical composition may use larger, more practical denominations for the current level.

3 After the rebuy deadline has passed, the player is permanently eliminated and their finishing position is stored.

4 Every elimination and rebuy action can be undone by the admin before a dependent action makes reversal unsafe — after that point, the admin uses **Correct Result**, which appends a compensating audit action rather than deleting history.

End-of-rebuy / add-on settlement break — a dedicated flow, not an ordinary timed break

1 The selected rebuy level ends (normally Level 6).

2 The timer **pauses automatically**.

3 Rebuys and late registration close **permanently** — no new player can be added from this point on, for any role.

4 Admin records any final valid rebuy from a hand that began before the deadline.

5 Poker Night calculates a recommended add-on stack from average stack, big blind, remaining players, total chips and target finish.

6 Admin selects each active player who purchases the one permitted add-on (maximum one per player).

7 Poker Night displays chip-exchange and colour-up instructions.

8 Admin confirms ante activation, or keeps antes off.

9 The final Prize Pool and private payouts are recalculated.

10 Admin confirms settlement is complete and **manually** starts the next level — nothing resumes automatically.

Live structure adjustments — always admin-approved, never automatic

Direction	Permitted changes	Hard restriction
-----------	-------------------	------------------

Speed up	20 → 15 min, 15 → 10 min; activate an approved ante early; increase future blinds	Takes effect from the next level only
Slow down	10 → 15 min, 15 → 20 min; insert one intermediate future level; soften blind growth; delay ante	Never removes a level
Manual edit	Edit a future blind or duration and preview the finish impact	Cannot edit a completed or active level

The admin always sees old structure vs. proposed structure, and current predicted finish vs. proposed predicted finish, before confirming any change.

Table balancing

When tables become unbalanced, the system proposes a move showing the source player, target table and target seat. The admin (or player) physically completes the move, then confirms — only after confirmation does the system update the seat map.

Final table (multi-table events only)

- 1 Nine players remain and the event previously used multiple tables → timer pauses.
- 2 Poker Night randomises all nine seats and the initial dealer position.
- 3 Admin reviews the seat list.
- 4 Players receive the updated assignments.
- 5 Admin confirms everyone is seated.
- 6 Play resumes — the app does not track dealer movement afterward.

If the event began on a single table, no redraw occurs — the system must not trigger an unnecessary redraw at nine players.

Admin-only module: minimal cash game (kept brief — separate from tournament flow)

Create session with fixed blinds → add and seat players → start session timer (no levels, no blind increases) → record each buy-in and later top-ups → record final cash-out value when a player leaves or the session ends → reconcile total issued vs. total returned → block final confirmation until the admin corrects the numbers or saves an explicit unresolved-difference note → save a private admin summary and a non-financial group history item.

3.3 Administrator — Can / Cannot (full permission table)

✓ CAN DO

✗ CANNOT DO

Create and edit groups, events, chip sets and tournament presets	Operate more than one administrator per event — the MVP allows exactly one
Publish invitations, pin event cards, create polls and moderate group chat	Delete a group that has an active tournament without resolving it first
Confirm or reject guest slot claims; check in any participant; assign or confirm seats	Assign a table/seat before check-in is confirmed
Start, pause, resume and finish the clock	Let the clock auto-resume after the settlement break — resuming is always a manual admin action
Record eliminations, rebuys, re-entries, add-ons and knockouts	Record a rebuy for a player outside the open rebuy window
Grant one add-on per active player during the settlement break	Grant a second add-on to the same player
Accept or reject live structure recommendations and edit <i>future</i> levels	Edit an active or already-completed level
Insert one intermediate future blind level when slowing down	Remove an existing level from the structure at any time
See all private calculations, including organizer percentage, organizer amount and every individual payout	Expose organizer or payout data to any non-admin client — this is blocked at the API level regardless of UI state
Correct or undo an operational action before the game is locked / before a dependent action makes reversal unsafe	Silently delete audit history — corrections always append a new compensating action
Add a late player before registration closes, with a fresh full starting stack	Add any player or guest after the rebuy level (registration) has closed — no exceptions
Propose and confirm a table-balancing move	Update the seat map before the physical move is confirmed
Trigger and confirm a final-table redraw when nine players remain in a multi-table event	Trigger a redraw for an event that began on a single table
Manually select exactly one device as the Audio Master for voice announcements	Have voice announcements play from more than one device simultaneously
View and operate the separate minimal cash-game module	Process or confirm real payments — the app records chip values only, never payment status
Finish the tournament and publish paid positions	Publish a result with an unvalidated paid position (more/fewer than one player per paid spot)

4. Registered Group Member — Complete Flow & Permissions

ROLE: REGISTERED GROUP MEMBER

STARTING POINT

Group invite link / QR / code

END GOAL

Attend or follow the event live and see the final result

ACCOUNT REQUIRED

Yes

4.1 Full start-to-end journey

- 1 Join the group.** Open the group invitation link, group QR code or group code → create an account or sign in → join the private group → gain access to Chat, Events, Polls, History and notifications.
- 2 Discover the event** — through the pinned group-chat card, the Events tab, or a notification. All decision-relevant information is visible before RSVP:
 - Tournament name, date and start time
 - Optional location
 - Buy-in
 - Rebuy closing level and cost
 - Add-on availability and price
 - KO bounty status and amount
 - Target duration
 - Host / admin identity
 - RSVP deadline
- 3 RSVP.** Select one response: Going, Going +1/+2/+3/+4, Maybe, or Can't Come.

Going +N automatically creates N named-but-unclaimed guest slots. The member can then share the event link, QR code or code with those invited guests. The response may be changed until one hour before the start time.
- 4 Pre-event experience:** receive event updates and RSVP reminders; use group chat and polls; see whether check-in is open; review location, start time and tournament rules; see whether invited guest slots have been claimed.
- 5 Check in.** Member arrives and opens the event → taps **Check In** → the request enters the admin queue → after admin confirmation, the member receives a table and seat → the main button changes to *View My Seat*, then *Open Live Tournament*.

- 6 **Follow the live tournament** once it starts — timer, current blinds/ante, next level, players remaining, average stack, own seat, announcements, and the running Prize Pool (labelled "Estimated" pre-settlement, "Prize Pool" after). Uses chat and polls freely throughout.
- 7 **If eliminated**, remains part of the event experience — continues following the timer, players remaining, Prize Pool, announcements, chat and polls. The interface clearly marks the member as eliminated without hiding the event.
- 8 **After the tournament**: sees the winner and every paid finishing position (no payout amounts); sees the completed event in group History; sees basic group-level, non-financial statistics (games played, wins, podium finishes, average finish, knockouts).

✓ **Goal reached**: attended (or followed) the event live from RSVP through to the published result, with group History and personal stats updated.

4.2 Registered Member — Can / Cannot (full permission table)

✓ CAN DO	✗ CANNOT DO
Join a group using its code, link or QR	Create or edit an event, group settings, chip sets, or tournament presets
Set or change their own RSVP up to one hour before the scheduled start	Change RSVP after the one-hour deadline — only the admin can correct or reopen it at that point
Create guest slots by responding Going +1 through +4, and share the invite with those guests	Claim one of their own guest slots as if they were the guest, or claim a slot created by another member
Reduce their guest count before any of those slots are claimed or checked in	Reduce their guest count below the number of guests already claimed or checked in without the admin resolving the conflict
Request self check-in, or be checked in by the admin	Assign themselves a table or seat — a seat is issued only after admin confirmation
Use group chat and tournament chat at any time, including after elimination	Use chat or polls before joining the group
Vote in group polls	Create or close a poll — poll creation and closing are admin-only
View live public game data: timer, blinds/ante, next level, players remaining, average stack, own seat, announcements, Estimated/confirmed Prize Pool	View who rebought, who purchased an add-on, the organizer percentage, the organizer amount, or any individual payout amount
View the completed podium and all paid finishing positions	View payout amounts at any point, before or after the tournament

View basic group-level, non-financial statistics (games played, wins, podiums, average finish, knockouts)	View personal or others' profit, ROI, or detailed financial history — this is not tracked in the MVP
Remain inside the live event experience after being eliminated	Record their own elimination, rebuy, or add-on — these are exclusively admin-recorded actions
Receive browser push and in-app notifications for event and RSVP updates	Moderate chat, delete another member's message, or remove a participant

5. New Guest — Complete Flow & Permissions

ROLE: NEW GUEST (NO ACCOUNT REQUIRED)

STARTING POINT

Event link / QR / code from an inviter

END GOAL

Get a confirmed seat and see how the event ends — with or without ever creating an account

ACCOUNT

REQUIRED
No

5.1 Full start-to-end journey

- 1 Receive event access.** The new guest receives a shared event link, QR code or event code from a registered member who selected Going +1, +2, +3 or +4. No account is required at any point in this flow.
- 2 Open the guest landing page** — a friendly, event-specific page, deliberately not the full application dashboard.
- 3 Identify the inviter and claim a slot:**
 - Guest selects "Who invited you?"
 - System displays only registered members who currently have unclaimed guest slots
 - Guest selects one available slot (e.g. "Alex's Guest 2")
 - Guest enters their name and confirms
 - The slot becomes reserved and cannot be claimed twice
 - The admin may correct or remove the reservation if needed
- 4 Before arrival.** The same event link remembers or securely resolves the claimed slot. The guest can see event details, inviter, their own guest name, current check-in status, and the Check In button once check-in opens.

At this stage the guest has: no access to group chat, no access to polls, no access to group History or member profiles — plus an optional prompt to create an account and join the group.
- 5 Guest check-in.** Guest arrives and taps **Check In** → admin receives the request → admin confirms the guest → guest receives a table and seat → the main button changes to *Open Live Tournament*.
- 6 Follow the limited live view:** timer, current blinds/ante, next level, players remaining, average stack, own seat, and announcements — the same core live tournament data a registered member sees, but with no chat, polls, or group content attached.

- 7 **After the tournament:** sees the winner and all paid positions, without money amounts. May optionally create an account and request to join the group; after admin approval, the guest's result can be linked to the new account.

✓ **Goal reached:** checked in, played or followed the tournament live, and saw the final result — the full journey completed without ever needing to create an account.

5.2 New Guest — Can / Cannot (full permission table)

✓ CAN DO	✗ CANNOT DO
Open the shared event link, QR code or event code without creating an account	Access any group content, or any other event, using this event's link or session
Select the registered member who invited them	See or select inviters who have no remaining unclaimed guest slots
Select one available, unclaimed guest slot and enter a display name	Claim a slot that is already reserved, checked-in, or claim a second slot for themselves
Request check-in once the admin opens it	Self-confirm check-in — every guest check-in requires explicit admin confirmation
View live public tournament data: timer, blinds/ante, next level, players remaining, average stack, own seat, announcements, Estimated/confirmed Prize Pool	View organizer percentage, organizer amount, individual payouts, or who rebought / bought an add-on
View final paid positions after the tournament (no amounts)	View payout amounts, at any point
Reopen the same event link later and have their reservation safely re-resolved	Switch to a different guest slot after check-in without admin approval
Optionally create an account after the event and request to join the group	Use group chat, polls, or view group History or member profiles as a guest
Receive event-scoped browser notifications after granting permission	Receive permanent group notifications — guests are not group members
Have a past guest result linked to a new account, once created and approved by the admin	Link a past result to an account without admin approval

6. Cross-Role Permission Matrix

A single side-by-side view of the highest-stakes permissions across all three roles, drawn directly from the reference specification's permission matrix.

Action	Admin	Registered Member	Guest
Create / edit event	Yes	No	No
Operate the timer	Yes	No	No
Record rebuy / add-on / elimination	Yes	No	No
RSVP	May edit any	Own response only	Guest slot only
Check in	Any participant	Self	Self (request only)
Chat and polls	Yes	Yes	No
View live Prize Pool	Yes	Yes	Yes
View payout amounts	Yes	No	No
View group History	Yes	Yes	No
Requires an account	Yes	Yes	No

7. Contextual Main-Button Logic (per role, per state)

Every event page shows exactly one dominant next action, calculated from role + event state + RSVP state + check-in state. This is what makes the product feel intelligent and prevents navigation errors — the person is never offered an action that is unavailable to them.

7.1 Priority order

- 1 **Blocking states take priority over everything else:** invalid invitation, event cancelled, check-in closed, or an action awaiting admin approval.
- 2 Before RSVP, the member/guest sees [Respond to Invitation](#).
- 3 After RSVP but before check-in opens, the member sees [Update RSVP](#) or [View Event](#).
- 4 When check-in opens, [Check In](#) overrides ordinary event actions.
- 5 After check-in, [View My Seat](#) is shown until the tournament goes live.
- 6 During play, [Open Live Tournament](#) is shown.
- 7 After finish, [View Results](#) is shown.

7.2 Full state table

State	Admin main action	Member / Guest main action
Event not yet published	Continue Setup / Publish Event	—
Published, no RSVP yet	Monitor RSVPs	Respond to Invitation
RSVP submitted, check-in not open	Monitor RSVPs / Prepare Chips	Update RSVP / View Event
Check-in open, not yet checked in	Open Check-in Queue	Check In
Checked in, tournament not started	Generate Structure / Start Tournament	View My Seat
Tournament live	Live Admin Controls	Open Live Tournament
Settlement break in progress	Record Rebuys / Add-ons	Follow announcement — informational only

Tournament finished	Review & Publish Results	View Results
---------------------	--------------------------	--------------

8. Notifications Matrix (per role)

8.1 Admin notifications

- New RSVP or RSVP change
- Guest slot claimed or released
- Check-in request
- Player or guest arrived
- Event starting soon
- Tournament ready to generate
- Rebuy period ending
- Rebuy / add-on settlement required
- Final-table redraw required
- Incomplete final results
- Realtime or recovery warning

8.2 Registered member notifications

- New event published
- Event details changed
- RSVP reminder, and RSVP closes in one hour
- Check-in opened / confirmed
- Seat assigned
- Tournament starting
- Rebuys closed
- Prize Pool confirmed
- Final table reached
- Tournament finished

8.3 New guest updates

An unregistered guest does not receive permanent group notifications. Event updates are shown through the event page itself, and may also use a browser notification only after explicit permission is granted:

- Guest slot confirmed
- Check-in opened / confirmed
- Seat assigned
- Tournament starting
- Rebuys closed
- Final table reached
- Tournament finished

8.4 Event change behaviour (affects admin + members)

When the admin changes date, time, location, buy-in, bounty or another visible event rule after publication, the system must: store the change in the audit timeline; notify all affected registered members; show the updated value prominently on the event page; mark important changes in the pinned chat card; require the admin to confirm whether existing RSVPs remain valid for a major date/time change.

9. Validation, Errors & Edge Cases (mapped to role)

9.1 Account and group

- Invalid email, weak password, duplicate account, Google sign-in failure — *affects member/admin sign-up*
- Expired, revoked or already-used group invitation — *affects prospective member*
- User already belongs to the group — *affects member*
- Admin attempts to delete a group with an active tournament — *blocked for admin*

9.2 Event and RSVP

- Start time set in the past — *blocked for admin at creation*
- Missing required event name, date, time, buy-in or duration — *blocked for admin at creation*
- RSVP submitted after the one-hour deadline — *blocked for member, admin may override*
- Member reduces guest count below the number of already-claimed or checked-in guests — *requires admin resolution*
- Event cancelled or rescheduled after RSVP — *all affected members notified*
- Duplicate submission from repeated taps — *guarded against for all roles*

9.3 Guest access

- Invalid, expired or revoked event code — *guest sees an explicit invalid-code state*
- QR points to a non-existent or inaccessible event — *guest sees an explicit error state*
- Inviter has no free guest slots — *guest cannot select that inviter*
- Slot claimed by another guest during confirmation — *first reservation wins; second guest must choose another slot*
- Guest tries to access chat, polls, or another event — *blocked server-side*
- Guest clears local browser storage — *must safely re-identify their reservation via the same link*

9.4 Chip and structure generation (admin-only surface, affects all roles' experience)

- Duplicate chip values are rejected
- Insufficient inventory produces a shortage warning and alternative recommendations
- Blind values that cannot be posted practically are rejected
- Generated levels must never use a duration other than 10, 15 or 20 minutes
- The admin can regenerate or edit inputs without losing recorded event attendance

9.5 Live tournament

- Accidental double elimination or duplicate rebuy is blocked, or easily undone — *admin-only actions*

- Admin closes or refreshes the page — the active tournament recovers locally on the admin's device
- Temporary internet loss — admin continues locally while other views show a connection-status banner
- After reconnection, queued admin actions synchronise without duplication
- Timer drift is corrected from the authoritative server timestamp, never trusted from a local countdown alone
- A player or guest arrives after late registration closes — the system prevents addition for every role
- The tournament reaches nine players but began on one table — no unnecessary redraw occurs

9.6 Safe destructive actions (admin-only)

- **Finish Tournament** requires confirmation and a review of final positions
- **Cancel Tournament** requires confirmation and a reason
- **Restart Level** requires confirmation and displays its exact effect before applying
- **Undo** always shows the specific action that will be reversed before it is reversed

10. Glossary

Term	Meaning
Group	A private, persistent community of regular players with its own chat, polls, history, presets and chip sets.
Event	One scheduled poker night created inside a group.
Live Tournament	The active, running phase of an event, beginning once the admin confirms attendance and starts the clock.
Guest slot	An unclaimed placeholder created automatically by a "Going +N" RSVP, later claimed by one specific guest.
Check-in	The confirmation step, always admin-approved, that turns an RSVP or guest reservation into an assigned table and seat.
Rebuy	A replacement stack of the same total value as the original starting stack, available only immediately after an elimination and only before the rebuy deadline.
Add-on	One optional additional stack purchase per active player, available only during the end-of-rebuy settlement break.
Settlement break	The dedicated, admin-guided pause that occurs automatically when the rebuy level ends, used to finalise rebuys, add-ons, chip exchanges, ante activation and the Prize Pool.
Final table	The redraw of all nine seats and the dealer position that occurs when a multi-table event reaches nine remaining players.
TV Mode	A separate, read-only display route with no controls and no private financial data.
Audio Master	The single device manually selected by the admin to play voice announcements; all other devices remain silent.
Estimated Prize Pool / Prize Pool	The public prize total shown to members and guests — "Estimated" before settlement, "Prize Pool" after.
Organizer amount	The host's private, calculated share of contributions — visible only to the admin, never to members or guests.

This document consolidates and reconciles the Poker Night Complete User Flow & Experience Specification v1.0, the MVP Technical Specification v2.0, and the Human Product Guide. Where sources used slightly different wording for the same rule, the more detailed and more specific version was used.
